

How does it give lifelong protection together?

Steel wire is protected by GI coating,
and GI coating is protected by chemical coating.

Why does it provide lifelong protection?

Double Coated Wire is galvanized steel wire that is given two layers of protection to prevent corrosion.

First Layer – Zinc Coating (GI) :

- ▶ Steel wire is galvanized by applying a zinc layer.
- ▶ This acts as a barrier, keeping air and moisture away from the steel surface.

Second Layer – Chemical Coating :

- ▶ An additional eco-friendly chemical coating is applied over the zinc-coated wire.

This thin layer :

- ▶ Protects the zinc surface
- ▶ Reduces white rust
- ▶ Increases corrosion resistance
- ▶ The top layer provides extra protection, shine, and durability.

How Double Coating Works :

In double coated wire, the zinc layer lasts much longer, and the steel remains protected for an extended period. Both layers together form a complete protection system: Zinc acts as a sacrificial layer, protecting the steel. The outer chemical coating acts like a shield, slowing zinc consumption and extending overall life

Key Differences

Normal GI Wire vs Double Coated Wire
(GI + Chemical Topcoat)

Parameter	Normal GI Wire	Double Coated Wire
Protective Layers	Single layer (only Zinc)	Dual layer (Zinc + Chemical coating)
Corrosion Resistance	Limited (in moisture/ saline conditions) – zinc corrodes faster	Chemical coating seals zinc, corrosion starts much later
Salt Spray Test (SST)	12–24 hours (white rust visible)	96–120+ hours (with double coating)
Life Span	5–7 years (under normal conditions)	15–20 years (under normal conditions)
Appearance	Dull finish	Bright blue finish
Environmental Compliance	Standard GI (no extra protection)	Eco-friendly, free from harmful chemicals
Cost	Lower initial cost	Slightly higher initial cost, but economical long-term (no frequent replacement)
Applications	General fencing	Premium fencing, coastal areas, industrial & agricultural use, long-term durability
Suitable For	Urban areas, open & clean environments	Agricultural areas where high water, fertilizers, and chemicals are used
